#### Installation instruction – first read completely, then act :

- In case **DW6.9\_HotfixPack18** was installed before then don't install it again, else newer files might be overwritten.
- Expand the Hotfix zip file into an empty folder.
- Result is a new folder with the same name as the Hotfix zip file. It contains a subfolder structure.
- Optionally remove subfolders in case the specific module / server is not installed.
- It is required NOT to rename the original files of your installation. This would lead to unexpected system behaviour. You should keep the original files by moving them to a different location (create an own folder).
- In the following table the column "Folder" lists the extracted folder(s), column "Files inside" lists the number of files inside this folders. Column "Location" lists where to copy the folder(s).
- In case of an in any way spreaded installation copy the relevant folders also onto the other machines.

#### Do you have a backup of your installation?

Folder :	Location:	Files inside:
SAP HTTP Server	<DocuWare installation path>	1

**Greyed out instructions are not relevant for this HotFix**

- **Stop service:**
  - SAP HTTP Server
- Stop IIS, or if not suitable, then stop only the Application Pools at IIS Manager / <Servername> :
  - DocuWare Platform Services App Pool
  - DocuWare Platform Services (RO) App Pool
- **ALL folders must be copied to the locations listed in column "Location". By this, files are replaced.**  
**Important: Answer system messages like "There is already a file with same name" by "Copy and replace".**
- Edit a config file or other file, if advised in description of fixed bugs. Find description below.
- Start IIS / previously stopped Application Pools again and clear the browser cache.
- **Start previously stopped services again.**
